

## A traduire

Cette page définit divers termes propres à PmWiki.

**page name** The *page name* is a string that [Pm Wiki](#) uses to refer to a page - i.e. it *names the page*. This could also be considered a *handle* for the page. The variable for the page name is simply called `{ $Name }`, which for this page is `Glossary`.

Note that there is no whitespace in page names, and by default Pm Wiki capitalizes each word in a page's name. There is however a variable `{ $Namespaced }` where spaces have been inserted, e.g. for the page `WikiSandbox` this variable would be `Wiki Sandbox`.

Note that Pm Wiki also uses the page name to locate per-group and per-page customization files in the `local/` subdirectory. For example, browsing `Main.WikiSandbox` would cause `local/Main.WikiSandbox.php` and `local/Main.php` to be loaded if these files existed.

**Page URI** Page names are used in URIs to tell Pm Wiki which page is to be loaded or acted upon. The normal form of a page URI is usually one of these two

`http://www.example.com/pmwiki/pmwiki.php?n=Main.WikiSandbox`

`http://www.example.com/pmwiki/pmwiki.php/Main.WikiSandbox`

Note that various aliasing and rewriting tricks can be used to modify this, but Pm Wiki expects to obtain a page name from the parameter 'n' or from the `PATH_INFO` component following the URI of the script ( `pmwiki.php` ).

Note that the parameter 'n' takes precedence over `PATH_INFO` if both are available.

**Page file name** The *page file name* is the name of the file that normally stores the data of a page in the directory `wiki.d/`. This file name is normally built directly from the page name.

**full page name** The *full page name* consists of a group and a name, e.g. `Main.WikiSandbox`. The variable for the full page name is `{ $FullName }`, which for this page is [Pm Wiki Fr](#). `Glossary`. Similarly, the variable for the group is `{ $Group }` which here is [Pm Wiki Fr](#).

**page link** A *page link* is something that is used to generate a link to a page. For example, the markup `[[wiki sandbox]]`, `[[ (wiki) sandbox ]]`, `WikiSandbox`, `Main/WikiSandbox`, `[[Main/wiki sandbox]]`, `[[Main.WikiSandbox | click here]]`, etc all specify a link to the page 'Main.WikiSandbox'. In each case Pm Wiki uses the context of the link to generate a page name from the page link -- normally by capitalizing each word found in the link and stripping any characters that aren't considered valid in page names.

**page title** A *page title* is the title element of a page, i.e. what is usually shown above the page and in the browser window's name. This title is normally set via the directive `( :title: )`, but if no such directive is given the title will be automatically generated from the page name. The title of a page is accessed via either the variable `{ $Title }` or the variable `{ $Titlespaced }`. The latter differs in that it uses the spaced version of the name.

**Default configuration** The way Pm has chosen to set all settings, or an individual setting, by default. For example, `$EnablePathInfo` is disabled by default. A wiki with no "local/config.php" file is using the default configuration. Likewise, a farm that only defines `$FarmPubDirUrl ?` in `farmconfig.php` is using the default configuration.

**Local customization** Any deviation from the default configuration. A related phrase is "farm-wide customization".

**Configuration file** A specially-named PHP script file where local customizations can take place for a farm, a wiki, a group, or a page.

**Farm-wide configuration file** A [Wiki Farm ?](#)'s `local/farmconfig.php` file, where any settings (besides [\\$FarmPubDirUrl](#)) customize the default configuration for all of the wikis in a farm.

**Local configuration file** A specially-named PHP script where local customizations can take place for an individual wiki. For an entire wiki it's named `local/config.php`. Individual groups and pages can also have their own local configuration files.

**Farm** A group of wikis that share code. Content and formats may or may not be shared. For more farm-related terms, including several which have been deprecated, see [WikiFarmTerminology ?](#)
