

Preferences for [access keys](#) and edit form

This page can be used as template for (personal) preferences, or set as default site preference (see below).

```
# Access keys - hold Alt (Windows IE), Shift + Alt (Firefox) # or Control (Mac)
and tap the indicated key on your keyboard # to trigger the corresponding
action. # 'ak_view' => '' , # view page 'ak_edit' => 'e', # edit page
'ak_history' => 'h', # page history # 'ak_print' => '', # print view of page
'ak_recentchanges' => 'c', # Recent Changes 'ak_save' => 's', # save page
'ak_saveedit' => 'u', # save and keep editing 'ak_savedraft' => 'd', # save as
draft 'ak_preview' => 'p', # preview page 'ak_textedit' => ',' # focus to edit
textarea (at the end) 'ak_em' => 'i', # emphasized text (italic) 'ak_strong' =>
'b', # strong text (bold) # 'ak_attach' => '', # attach a file # 'ak_backlinks'
=> '', # show backlinks # 'ak_logout' => '', # log out # Editing components
'e_rows' => '20', # rows in edit textarea 'e_cols' => '70', # columns in edit
textarea 'Site.EditForm' => 'Site.EditForm' # location of EditForm
```

To create personal user (browser) preferences,

- make a copy of [this page](#) somewhere, preferably as `Profiles.insert_your_name_here-Preferences`
- edit that page with your new preferred settings,
- select [Set Preferences of this Page](#) on the page containing your newly created settings.

This sets a preference cookie on your browser which tells [Pm Wiki](#) where to find your personal preference settings.

To revert to the Pm Wiki default preferences

- select [Revert to PmWiki Default Preferences](#) to unset the preference cookie

See also [Cookbook:UserConfigurations](#) about how to customise the edit form for personal use.

Note that by default, parsing of Site.Preferences is disabled. To make it the default site preference, add

```
XL Page?('prefs', "Site.Preferences");
```

to a config file (e.g. local/config.php).

To disable user preferences entirely set `$EnablePrefs = 0;`
